Assignment V

10/28/2019

Instructor: Assefaw Gebremedhin

Student: Yu-Chieh Wang 11641327

1. Logistic regression

$$\sigma(f(x)) = \frac{e^{f(x)}}{1 + e^{f(x)}}$$

$$f(x) = -7 + 0.1(x_1) + 1(x_2) - 0.04(x_3)$$

a.
$$f(x) = -7 + 3.2 + 3 - 0.48 = -1.28$$

$$\sigma(-1.28) = \frac{e^{-1.28}}{1 + e^{-1.28}} = 0.21755$$

b.
$$e^{f(x)} = 0.5(1 + e^{f(x)})$$

$$e^{f(x)} = 1$$

$$f(x) = 0 = -7 + 0.1(x_1) + 3 - 0.48$$

$$x_1 = 44.8$$

c.
$$e^{f(x)} = 0.5(1 + e^{f(x)})$$

$$e^{f(x)} = 1$$

$$f(x) = 0 = -7 + 0.1(x_1) + 3 - 0.12$$

$$x_1 = 41.2$$

	X1	X2	Х3	Pi(f(x))
а	32	3	12	0.21755
b	44.8	3	12	0.5
С	41.2	3	3	0.5

2. Naive Bayes Classification

a. Data collection

-Use newsapi to get news from the datasets.

-The result shows as a dictionary:

```
/usr/local/bin/python3.7 /Users/angel/PycharmProjects/DataScience/hw5/question_2_b.py
[{'source': {'id': None, 'name': 'Space.com'}, 'author': 'Mike Wall', 'title': 'Mars Rover Curiosity Snaps Be
[{'source': {'id': None, 'name': 'Cbssports.com'}, 'author': '', 'title': 'World Series: Dave Martinez ejecte
[{'source': {'id': 'the-times-of-india', 'name': 'The Times of India'}, 'author': 'TIMESOFINDIA.COM', 'title'
[{'source': {'id': 'cbs-news', 'name': 'CBS News'}, 'author': 'Kate Gibson', 'title': 'Johnson & Johnson Baby
[{'source': {'id': 'usa-today', 'name': 'USA Today'}, 'author': 'Jesse Yomtov', 'title': "Nationals' Trea Tur
```

-The dictionary has many keys such as source, id, name, author, title, content, etc.

b. Data cleaning

```
m newsapi import NewsApiClient
ort numpy as np
data = np.array([])
Alldata = []
 ef getPlan(data):
Alldata = []
      Alldata = []

for i in range(len(data)):
    del data[i]["source"]
    del data[i]["author"]
    del data[i]["description"]
    del data[i]["title"]
    del data[i]["url"]
    del data[i]["urlToImage"]

del data[i]["publichedd:"]
           del data[i]["publishedAt"]
           Alldata.append(data[i])
     return np.array(Alldata)
newsapi = NewsApiClient(api_key='9cd9ca0dc6ec44388be32fb87220cb75')
Alltop = ["science", "general", "health", "business", "entertainment", "sports"]
 for i in range(len(Alltop)):
     data = np.array([])
     data = newsapi.get_top_headlines(category=Alltop[i], language='en', country='us', page_size=100).get('articles')
     #data = top_headlines.get('articles')
     print(data)
     Alldata.append(getPlan(data))
#print(data)
print(Alltop[1])#general
print(Alldata[1][2]["content"])# the thired article in general
print(type(data))
```

- -Delete other keys which won't be used, and only leave the content.
- -The output result is as following:

```
/usr/local/bin/python3.7 /Users/angel/PycharmProjects/DataScience/hw5/question_2_b.py
general
{'content': "At least two people were killed after a 6.6—magnitude earthquake struck the southern Philippines on Tuesday,
```

c. Tokenization

```
def replaceSystem(string):
    for char in string:
        if char in "~!@#$%^&*()[]{},+-|/?<>'.;:0123456789":
        string = string.replace(char, '')
    return string

def split line(text):
    text = replaceSystem(text)
    text = text.lower()
    words = text.split()
    return words
```

- -First, replace numbers and punctuation with blanks.
- -Second, separate each word by blanks.

```
from collections import Counter
 count = [[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[]_{*}[
 #print(type(count[0]))
  for i in range(6):
                         count[i] = Counter()
#print(type(count[i]))
print("start get dic")
 for i in range(len(Alldata)):
                         for j in range(len(Alldata[i])):
                                                 #print("ij", i, j)
                                                 alist = Alldata[i][j]["content"]
                                                  if alist!=None:
                                                                          alist = split_line(alist)
                                                                          for word in alist:
                                                                                                   count[i][word] += 1
                         print("finish", i + 1, "/6")
                         print(count[i])
```

- -Next, use collections. Counter function to make each word become a dictionary key.
- -The result is as following:

```
Counter({'the': 155, 'of': 88, 'a': 80, 'to': 62, 'chars': 61, 'in': 46, 'and': 43, 'that': 35, 'on': 24, 'for': 22, 'new': 17, 'is': 16, finish 2 /6
Counter('the': 80, 'a': 39, 'of': 37, 'chars': 37, 'to': 37, 'and': 31, 'that': 20, 'in': 20, 'on': 19, 'has': 15, 'tuesday': 14, 'for': finish 3 /6
Counter('the': 98, 'a': 86, 'of': 74, 'chars': 61, 'to': 51, 'and': 47, 'in': 45, 'with': 30, 'that': 30, 'is': 27, 'have': 21, 'health' finish 4 /6
Counter({'the': 149, 'a': 85, 'of': 65, 'chars': 64, 'to': 63, 'in': 53, 'and': 46, 'that': 34, 'for': 30, 'on': 28, 'is': 22, 'as': 20, finish 5 /6
Counter({'the': 139, 'a': 75, 'of': 65, 'and': 65, 'chars': 63, 'to': 58, 'in': 55, 'for': 34, 'on': 27, 'is': 24, 'at': 21, 'with': 20, finish 6 /6
Counter({'the': 220, 'a': 76, 'to': 68, 'chars': 66, 'of': 60, 'in': 47, 'and': 45, 'for': 33, 'on': 31, 'that': 25, 'it': 24, 'is': 24,
```

-I was trying to use the package to detect each part of speech, but every package I used has SSL problem, and I don't know how to solve it.

```
import nltk
nltk.download('punkt')
from collections import Counter
def replaceSystem(string):
    for char in string:
        if char in "~!@#$%^&*()[]{},+-|/?<>'.;:0123456789\"":
            string = string.replace(char, '')
    return string
def split_line(text):
    text = replaceSystem(text)
    text = text.lower()
    words = text.split()
    return words
    tokens = nltk.word tokenize(text.lower())
    print(tokens)
    mytext = nltk.Text(tokens)
    print(mytext)
    tags = nltk.pos_tag(mytext)
    print(tags)
    counter = Counter()
    for tag, word in tags:
        counter[tag]+=1
    print(counter)
```

-The Error result is as following:

```
/usr/local/bin/python3.7 /Users/angel/PycharmProjects/DataScience/hw5,
[nltk_data] Error loading punkt: <urlopen error [SSL:
[nltk_data] CERTIFICATE_VERIFY_FAILED] certificate verify failed:
[nltk_data] unable to get local issuer certificate (_ssl.c:1045)>
```

d. Classification

-I didn't finish this part because it already runs out of time. So far, I make a matrix of each article, but I cannot combine these matrixes. As long as I finish combine them, I can use sklearn. SCV to do the machine learning, which uses Naive Bayes when its parameter 'kernel' equal to 'rdf'. To compare with other algorithms, it's a good function for predicting multi-class labels and easy for operating.

-The code should look like the following:

```
from sklearn import svm
import numpy as np
X = np.array([[-1, -1], [-2, -1], [1, 1], [2, 1]])
y = np.array([1, 1, 2, 2])

clf = svm.SVC(kernel='rbf')
clf.fit(X, y)
print("prediction:", clf.predict([[0.8, -1]]))
```

-The output result is as following:

prediction: [1]
